

MARKET SUMMARY REPORT

February 2024

UNDERSTANDING THIS MARKET SNAPSHOT

Use the information in this email to identify trends and movements affecting electricity in the ERCOT market to make informed energy decisions. Here are a few quick tips:

- **Power prices** are determined from forward Heat Rate and natural gas strips for a specific timeframe. $Power\ Price = Heat\ Rate \times Natural\ Gas\ Price$. Power prices can change based on electricity supply and demand, which is driven by factors such as weather, the economy, available generation and grid conditions.
- **Natural Gas** prices are a key driver of power prices because natural gas fuels the power plants that are brought online primarily to satisfy peak demand.

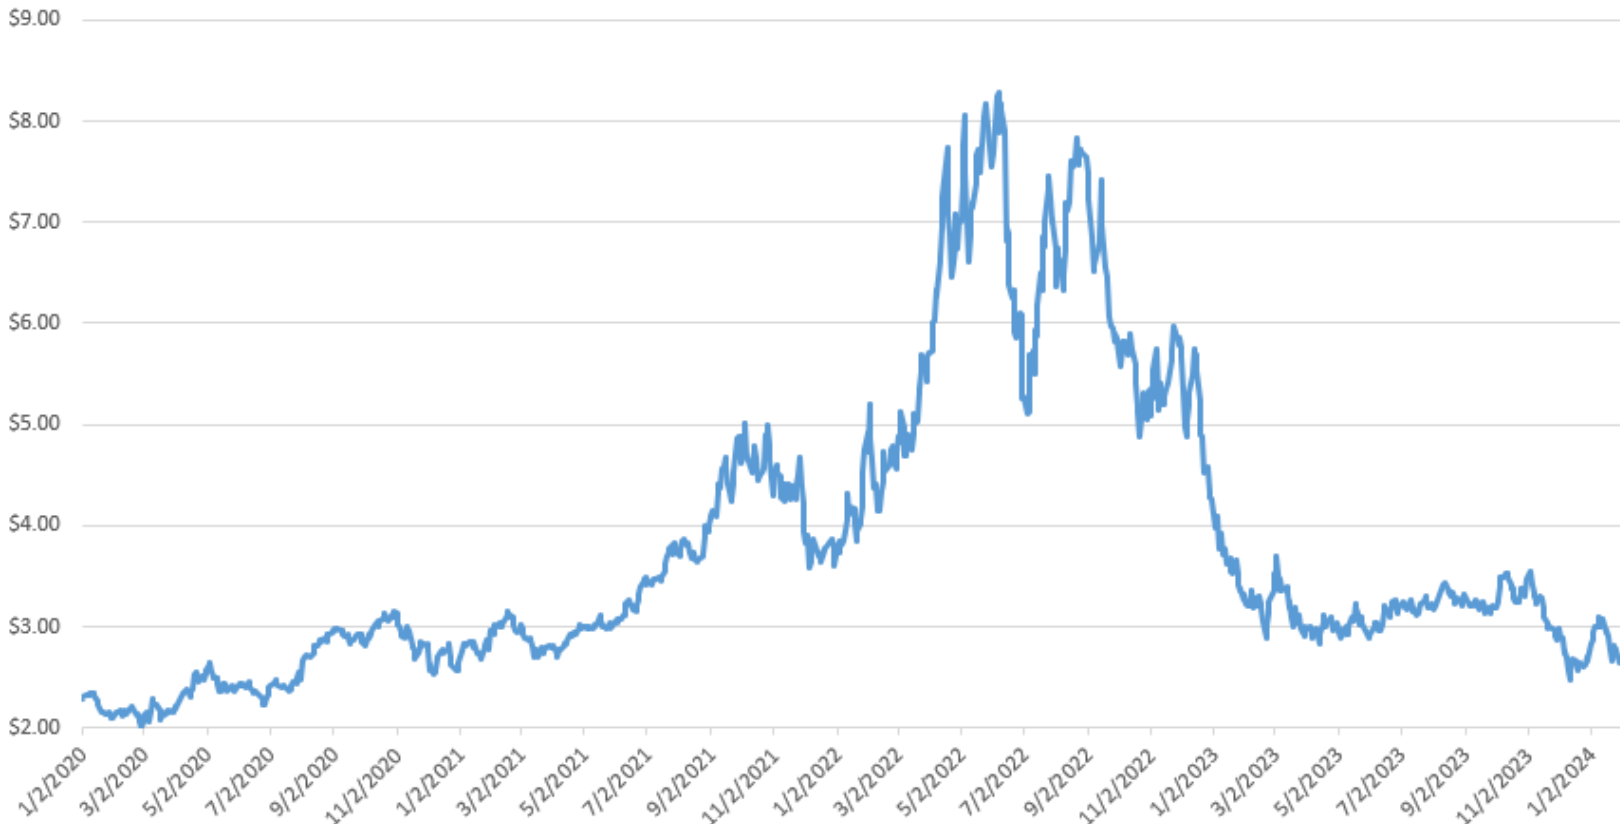

Heat Rates are the common measure of power plant efficiency and are derived from power and natural gas prices: $Heat\ Rate = Power\ Price \div Natural\ Gas\ Price$. Heat rates are typically higher when gas prices are lower. Heat rates are impacted by weather, regulatory changes, consumer demand and power plant retirements.
